# Table of Contents

Aggregate Demand

Multipliers

Short-Run Aggregate Supply (SRAS)

Long-Run Aggregate Supply (LRAS)

Equilibrium in the Aggregate Demand-Aggregate Supply (AD-DS) Model

Change in the AD-AS Model in the Short Run

Long-Run Self Adjustment

Fiscal Policy

Automatic Stabilizers

# Aggregate Demand

---

## The Wealth Effect

- Higher price levels reduce the purchasing power of money, which decreases the quantity of expenditures.
- Lower price levels increase purchasing power and increase expenditures

## Interest Rate Effect

- When the price level increases, lenders charge higher interest to get a REAL return on their loans

## Foreign Trade Effect

- When price levels rise, foreign buyers purchase fewer U.S. goods and Americans buy more foreign goods.  $X_n$  decreases.

An aggregate demand curve

Figure 1  
An aggregate demand curve

# Multipliers

---

- Marginal Propensity to Save (MPS); How much people save instead of consume when there is a change in income. Expressed as

$$MPS = \frac{\Delta \text{savings}}{\Delta \text{Disposable Income}}$$

- Marginal Propensity to Consume (MPC); How much people consume rather than saving when disposable income changes. Expressed as a fraction:

$$MPC = \frac{\Delta \text{consumption}}{\Delta \text{Disposable Income}}$$

- Spending Multiplier

$$\frac{1}{MPS} = \frac{1}{1 - MPC}$$

- Simple Tax Multiplier

$$\frac{MPS}{MPC}$$

# Short-Run Aggregate Supply (SRAS)

---

## Things that can affect SRAS

- Change in the prices of resources
- Changes in taxes, subsidies, or regulations
- Change in productivity
- Expectations

$$Y = Y^* + \alpha(P - P_e)$$

## Long-Run Aggregate Supply (LRAS)

---

- The curve shows what we can produce at the natural rate of unemployment.
- A recessionary gap doesn't necessarily mean there's a recession.
- The curve shows relationship between price level and real GDP if everything was fully flexible. LRAS is vertical.

$$Y = Y^*$$

# Equilibrium in the Aggregate Demand-Aggregate Supply (AD-DS) Model

---

- Puts aggregate demand and aggregate-supply together.
- Recessionary gap doesn't necessarily mean there's a recession

## Change in the AD-AS Model in the Short Run

---

- This unit revolves around shifting curves, specifically SRAS, AD1
- Positive supply shock: the short supply increase.
- Cost push inflation, supply shifts left, and demand-pull shifts right.

## Long-Run Self Adjustment

---

- Idea that the economy self-adjusts; it's not demand that changes, it's shortened supply.
- If flexible, short ag will shift to the right, putting back at full employment.

# Fiscal Policy

---

- Government gets involved.
- Expansionary fiscal policy; laws that reduce unemployment and increase GDP; increases spending, decrease taxes, combinations of the two.
- Contractionary fiscal policy; laws that reduce inflation, decrease GDP; decrease government spending, increase taxes, combinations.

## Automatic Stabilizers

---

- Discretionary fiscal policy; congress creates new bills that changes AD through spending
- Non-Discretionary fiscal policy; aka. automatic stabilizers. Permanent spending or taxation laws to work counter cyclically to stabilize the economy.
- When GDP goes down, government spending automatically increase, and taxes fall
